

Jerry (Yuan) Zhou

ABOUT

I'm interested in the underlying structure of computing systems, from OSes, ISAs, ICs, networking, to security, and how they interact from hardware up to distributed software stacks. I've been working on large-scale AI systems to make training and inference efficient and reliable. I also spend time pondering true machine intelligence and how such systems might be implemented.

AWARDS

REGIONAL SECOND PLACE

DIVISION II, ACM-ICPC

2019

SITE FIRST PLACE

DIVISION II, ACM-ICPC

2017

FIRST PRIZE

NATIONAL OLYMPIAD OF

INFORMATICS IN PROVINCE,

CHINA COMPUTER FEDERATION

2014

SKILLS

- Large-scale AI systems (training, inference)
- GPU systems and performance optimization (MFU, kernels)
- Numerics (MXFP8/NVFP4, quantization, stochastic rounding)
- Systems programming (C/C++/Go/Python)
- ML systems debugging and cross-stack diagnosis
- Linux and low-level debugging

EDUCATION

UNDERGRADUATE | UNIVERSITY OF CALIFORNIA, BERKELEY

Aug 2017 - May 2020 | Berkeley, CA | B.A. Computer Science

GPA: 3.854 | Major GPA: 3.976 | Major Upper Div. GPA: 4.000

EXPERIENCE

MEMBER OF TECHNICAL STAFF | MICROSOFT AI

Sep 2025 - Present | Mountain View, CA

- Improved MFU and training stability by optimizing numerics across pretraining, post-training, and inference pipelines for large-scale foundation models.
- Integrated MXFP8 across training and post-training stacks, enabling low-precision training with minimal quality loss.
- Developed stochastic rounding methods for low-precision training, improving convergence under aggressive quantization.
- Aligned training and SGLang inference numerics, reducing mismatch and improving post-training and serving consistency.

SENIOR SYSTEM SOFTWARE ENGINEER | NVIDIA CORPORATION

Jun 2020 - Sep 2025 | Santa Clara, CA

- Leading core security initiatives across advanced GPU, CPU, DPU, and NIC architectures.
- Resolving critical system-level issues across organizational boundaries and global time zones.
- Analyzing low-level hardware and assembly traces.
- Designing and architecting next-generation security and power-efficiency features for upcoming chip platforms.

SELECTED PROJECTS

ATHENA AI

<https://athenalab.ai/>

Nov 2024 - Present | Node.js

- A production-ready general-purpose AI agent framework with planning, memory, and reflection capabilities.
- Plugin-based architecture for dynamic tool use and extensible workflows.
- Contextual memory and self-correcting execution for autonomous task handling.

TROJAN-GFW

<https://github.com/trojan-gfw/trojan>

Oct 2017 - Present | C++

- A fast and lightweight obfs web proxy aiming at penetrating DPI (Deep Packet Inspection) firewalls.
- Features anti active and passive protocol detection.
- Received **19k+ stars** on GitHub, has millions of users, and gained its entrance into major Linux distributions, such as Debian and Arch Linux.

LANDROP

<https://landrop.app/>

Jan 2021 - Present | C++, Electron, Flutter

- A cross-platform file transfer tool that allows you to share files between different devices.
- Gained millions of users and helped transfer over 100 million files.
